</table>
I. JOB SITE CONDITIONS

A. Installation should not begin until after all other trades are finished in the area. If the job requires other trades to work in the area after the installation of the floor, the flooring should be protected with an appropriate cover.

B. Areas to receive flooring should be weather tight and maintained at a minimum uniform temperature of 65˚ F (18˚ C) for 48 hours prior to, during and after installation.

II. SUBFLOORS

ECOnights, ECOsand, ECOstone, ECOearth, ECOrocks ECOcomfort rolls and tiles, may be installed over concrete, approved cementitious based self-leveling materials such as Ardex K-15 or equivalent, and wood.

Note: Ardex Engineered Cements
400 Ardex Park Drive
Aliquippa, PA 15001
(724) 203-5000

Note: Gypsum based patching and leveling compounds are not acceptable.

A. Wood Subfloors: Wood subfloors should be double construction with a minimum thickness of 1". The floor must be rigid, free from movement and have at least 18" of well-ventilated air space below.

B. Underlayments: The preferred underlayment panel is APA underlayment grade plywood, minimum thickness of 1/4", with a fully sanded face.

Note: Particle board, chip board, Masonite, and lauan are not considered suitable underlayments.

C. Concrete Floors: Concrete shall have a minimum compressive strength of 3000 psi. It must be fully cured and permanently dry.

III. SUBFLOOR REQUIREMENTS AND PREPARATION

A. Subfloor shall be dry, clean, smooth, level, and structurally sound. They should be free of dust, solvent, paint, wax, oil, grease, asphalt, sealers, curing and hardening compounds, alkaline salts, old adhesive residue and other extraneous materials, according to ASTM F710.

B. Subfloor should be smooth to prevent irregularities, roughness, or other defects from telegraphing through the new flooring. The surface should be flat to the equivalent of 3/16" (4.8 mm) in 10 feet (3.0 m).

C. Mechanically remove all traces of old adhesives, paint or other debris by scraping, sanding or scarifying the substrate. Do not use solvents. All high spots shall be ground level and low spots filled with an approved cementitious based patching compound.

D. All saw cuts (control joints), cracks, indentations and other non-moving joints in the concrete must be filled with an approved cementitious based patching compound.

E. Expansion joints in the concrete are designed to allow for expansion and contraction of the concrete. If a floor covering is installed over an expansion joint, it more than likely will fail in that area. Expansion joint covers designed for resilient floor coverings should be used.

F. Always allow patching materials to dry thoroughly and install according to the manufacturer's instructions. Excessive moisture in patching material may cause bonding problems or a bubbling reaction with the E-Grip II™ adhesive.
HAZARDS:

SILICA WARNING - Concrete, floor patching compounds, toppings and leveling compounds can contain free crystalline silica. Respirable crystalline silica (particles 1-10 micrometers) can be produced by cutting, sawing, grinding or drilling. Respirable silica is classified by OSHA as a 1A carcinogen and is known to cause silicosis and other respiratory diseases. Avoid actions that cause dust to become airborne. Use local or general ventilation, or protective equipment, to reduce exposure below applicable exposure limits.

ASBESTOS WARNING - Resilient flooring, backing, lining felt, paint or asphaltic “cutback” adhesives can contain asbestos fibers. Avoid actions that cause dust to become airborne. Do not sand, dry sweep, dry scrape, drill, saw, beadblast or mechanically chip or pulverize. Regulations may require that the material be tested to determine asbestos content. Consult the documents titled, Recommended Work Practices for Removal of Existing Resilient Floor Coverings, available from the Resilient Floor Covering Institute.

LEAD WARNING - Certain paints can contain lead. Exposure to excessive amounts of lead dust presents a health hazard. Refer to applicable federal, state and local laws and the publication, Lead Based Paint: Guidelines for Hazard Identification and Abatement in Public and Indian Housing, available from the United States Department of Housing and Urban Development.

G. Maximum moisture vapor emission of the concrete must not exceed 5.5 lbs. per 1000 sq. ft. in a 24 hour period as measured by the calcium chloride moisture emission test conducted in accordance to ASTM F1869. If the emissions exceed the limitations, the installation should not proceed until the problem has been corrected.

H. It is essential that pH tests be taken on all concrete floors. If the pH is greater than 9, it must be neutralized prior to beginning the installation.

IV. MATERIAL STORAGE AND HANDLING

(ECOnights, ECOsand, ECOstone, ECOearth, ECORocks and ECOcomfort)

Rolls and Tiles

A. Material should be delivered to the job site in its original unopened packaging with all labels intact.

B. Roll material should always be stored laying down. Storing rubber on end will curl the edges resulting in permanent memory of the material. All edges with memory curl must be straight edge cut before installation. Do not store rolls higher than 4 rolls or more than six months. Material should only be stored on a clean, dry, smooth surface.

C. Inspect all material for visual defects prior to beginning the installation. No labor claim will be honored on material installed with visual defects. Verify the material delivered is the correct style, color and amount. Any discrepancies must be reported immediately before beginning installation.

D. The material and adhesive must be climatized at room temperature for a minimum of 24 hours before starting installation.

E. All ECOsurfaces rolls must be unrolled and installed in the same direction, (directional arrows are stamped on bottom of the rolls). ECOsurfaces tiles must also be installed in the same direction (arrows on the bottom must be pointing in the same direction). Rolls are labeled with batch numbers and roll numbers. Do not
mix batch numbers together and install all rolls in consecutive order. See diagram 1.

Note: One side of each cardboard core containing ECOsurfaces rolls is marked with red dye. Unroll the flooring so that all of the cores have the markings on the same side.

F. Roll material is stretched slightly when it is rolled at the factory. At the job site the installer should allow all cuts to relax for a minimum of two hours before gluing down.

V. INSTALLATION - SHEET
(ECOnights, ECOsand, ECOstone, ECOearth and ECOrocks)

A. Cut the first sheet at the required length including enough to run up the wall and overlap for seaming at each end.

B. Position the first sheet against the wall and square with the room.

C. Cut second sheet with proper extra length.

D. Position second sheet with a 1"-1.5" overlap over the first roll at the seam.

E. Repeat for each consecutive sheet necessary to complete the area or those rolls that will be installed that day.

F. Allow the cuts to relax in position for a minimum of 2 hours before gluing.

G. SEAMING METHODS

1. (4 mm & 6 mm thick material) Place a 4" wide scrap of material under the seam area. Using a straight edge and new razor blade, hold the knife straight up and down and cut through both pieces in one cut. (See diagram 2).

2. (9 mm thick material) Snap a chalk line where the seam will be located. Straight edge seam edge of first piece. Align the first edge to the chalk line; it is very important that the seam is perfectly straight. Straight edge seam edge of second drop and butt to first edge. Do not try to compress or stretch the material.

H. After all above procedures are performed, begin application of ECORE's E-Grip II, recommended one-component polyurethane adhesive. Apply E-Grip II to the substrate using a 1/16" square notched trowel. Use a new trowel for each pail of adhesive or more frequently if trowel begins to wear down, do not re-notch the trowel.

I. Fold the first drop lengthwise (half the width of the roll).
J. Spread adhesive using proper notch trowel. Take care not to spread more E-Grip II than can be covered by flooring and rolled within 30 minutes. The open time of the adhesive is 30 - 40 minutes at 70°F and 50% relative humidity.

Note: The open time of adhesive is affected by temperature and humidity. High temperatures and high humidity will cause the adhesive to set up quickly. Low temperatures and low humidity will cause adhesive to cure at a slower rate. The installer should monitor on-site conditions and adjust open time accordingly.

K. Carefully lay the material into the wet adhesive. DO NOT let the material drop because this will cause air to be trapped beneath the flooring.

L. Immediately roll the floor with a 100 lb roller to ensure proper transfer of adhesive. Overlap each pass of the roller by 50% of the previous pass to ensure that the floor is properly rolled. Roll the width first then the length. Re-roll again after 30-45 minutes.

M. Fold over second half of first roll and half of second sheet. Spread adhesive. At seam area spread adhesive at 90 degrees to seam to eliminate excessive adhesive oozing up at seam. Roll material.

N. With 4mm thick material it may be necessary to weight down the seam until the adhesive sets. Boxes of cove base work well. Cover the entire seam.

O. Continue the process for each consecutive drop. Always work at a pace so that you are always folding material back into wet adhesive.

Note: Never leave adhesive ridges or puddles, they will telegraph through the material.

P. Do not allow E-Grip II to cure on your hands or the flooring. Immediately wipe off excess adhesive with a rag dampened with mineral spirits! Cured adhesive is very difficult to remove. **We strongly suggest wearing gloves when using E-Grip II.**

Q. Hand roll all seams after the entire floor has been rolled. If some seams are gapping, hold them together temporarily with masking tape. Do not use duct tape as it may leave a residue on the floor. Remove tape after adhesive has developed a firm set.

R. After you rolled the floor, keep all foot traffic off the floor for a minimum of 24 hours. Foot traffic and rolling loads can cause permanent indentations or bubbles in the uncured adhesive.

VI. INSTALLATION - TILES
(ECOnights, ECOsand, ECOstone, ECOearth and ECOrocks)

A. General: Make sure all material is from the same batch number. Mix tiles from several boxes or skids. Ensure that moisture, pH, and bond tests have been conducted with passing results. Ensure that jobsite and subfloor conditions are met.

B. Measure the width of the area to be covered.

C. Mark the center of the area at two points, one at each end.

D. Snap the chalk line, line #1, through these two points.

E. Determine the center point of the chalk line.

F. Using a Carpenter’s square or an other method, snap a second chalk line, line #2, perpendicular (at 90 degrees) to the first line. The lines should intersect at their centers.
G. The area to be covered is now divided into quarters. Begin the installation at the center of the area, where the two lines intersect.

Note: To lay tiles in an ashlar configuration, snap a third chalk line perpendicular to line #2 and parallel to line #1. The distance between line #1 and line #3 should be 1/2 the width of the tile (9 or 18 inches). See diagram 6.

H. After the above procedure is performed, begin application of ECORE's E-Grip II, recommended one-component polyurethane adhesive. Apply E-Grip II to the substrate using a 1/16" square notched trowel. Use a new trowel for each pail of adhesive or more frequently if trowel begins to wear down, do not re-notch the trowel.

I. Take care not to spread more adhesive than can be covered by flooring and rolled within 30 minutes.

J. Place the first tile A into the wet adhesive making sure that the edges are precisely placed along the chalk lines and where they intersect. Press firmly on the tiles to remove any curls or entrapped air. Do not try to stretch or compress fit the tiles. See diagram 5a and 5b above.

Reminder: Arrows on bottom of tiles must point in the same direction.

K. Lay whole tiles from left to right along chalk line #1 up to the wall on the opposite side of chalk line #2. The last tile will likely have to be cut to fit against the wall.

L. Do not allow E-Grip II to cure on your hands or the flooring. Wipe off excess adhesive with a rag dampened with mineral spirits! Cured adhesive is very difficult to remove from hands. **We strongly suggest wearing gloves when using E-Grip II.**

M. Continue this process with each row until you reach the wall across from chalk line #1.

N. Go back and fill in gaps between the two original chalk lines and the wall on those two sides.

O. If some seams are gapping, hold them together temporarily with masking tape. Do not use duct tape as it may leave a residue on the floor. Remove the tape after the adhesive has developed a firm set. It may be necessary to weigh down some seams.

P. Roll a 100 lb roller over the floor within 45 minutes to ensure proper transfer of adhesive. Overlap each pass of the roller by 50% of the previous pass to ensure that the floor is properly rolled. Re-roll again after 30-45 minutes.
Q. Keep foot traffic off the floor for a minimum of 24 hours. Foot traffic and rolling loads can cause permanent indentations in the uncured adhesive and cause tiles to shift.

VII. ECOPAVE MOLDED TILES

Note: All ECOpave products are to be installed over a solid substrate.

Split Pavers (7/8" thick) must always be adhered to the substrate.

Full Pavers (1 3/4" thick) may be adhered or loose-laid. If loose-laid, pavers must be installed against a perimeter border system (see instructions page 8).

4. After all above procedures are performed, begin application of ECORE’s E-Grip II, recommended one component polyurethane adhesive. Apply E-Grip II to the substrate using a 1/8” square notched trowel. Monitor the tooth size of the trowel blade frequently, and use a new blade with each new pail of adhesive.

5. Apply E-Grip II evenly at a rate of approximately 60 sq. ft./gallon over smooth concrete. Various substrates may effect this coverage rate. Do not allow E-Grip II to cure on your hands or the flooring. Wipe off excess adhesive with a rag dampened with mineral spirits! Cured adhesive is very difficult to remove from hands. We strongly suggest wearing gloves when using the E-Grip II.

6. Place the first tile into the wet adhesive making sure that the edges are precisely placed along chalk lines and where they intersect. Press firmly on the flooring to remove any curls or entrapped air.

B. LAYING TILES - INDOOR

1. Pavers: Interlock and shift whole pavers from left to right along chalk line #1 up to the wall on the opposite side of chalk line #2. The last paver will likely have to be cut to fit against the wall. See diagram 7.

2. Tiles & Paver tiles: Place the first tile A into the wet adhesive making sure that the edges are precisely placed along the chalk lines and where they intersect. Press firmly on the tiles to remove any curls or entrapped air. See diagram 5a or 5b on page 5.
3. Continue this process with each row until you reach the wall across from chalk line #1.

4. Go back and fill in gaps between the two original chalk lines and the wall on those two sides.

5. Immediately roll the floor with a 150 lb. roller to ensure proper transfer of adhesive. Overlap each pass of the roller by 50% of the previous pass to ensure that the floor is properly rolled. Roll the width first then the length. Re-roll again after 30-45 minutes.

6. Keep foot traffic off the floor for a minimum of 24 hours. Foot traffic and rolling loads can cause permanent indentations in the uncured adhesive and cause tiles to shift.

7. Allow the adhesive to cure for a minimum of 12 hours before applying any sealer to the floor.

C. OUTDOOR INSTALLATION

1. Glued down installation on concrete, asphalt and crushed stone. Base materials for ECOpave are fully cured concrete or asphalt. Both are ideal for load bearing areas with heavy traffic or moving vehicles.

2. Make sure to allow for a 1.5% slope or fall for moisture movement to drainage pit.

3. Bituminous concrete mixture requirements for asphalt top layer specifications are outlined above:

<table>

</table>

Note: A filter fabric is necessary for crushed stone bases. Tiles are adhered to the filter fabric. This filter fabric system will allow moisture to penetrate between surface joints and to evaporate in the base. Some bases will require a plastic perforated drain pipe to remove possible moisture build-up.

4. Lay out molded pavers/tiles before adhering to minimize cutting and waste.

5. Always begin installation with chalk lines that are perfectly square. It is best to begin laying product away from the walls.

6. After all above procedures are performed, begin application of ECORE’s E-Grip II, recommended one component polyurethane adhesive. Apply E-Grip II to the substrate using a 1/8" square notched trowel. Monitor the tooth size of the trowel blade frequently and use a new blade as needed to ensure the proper amount of adhesive is applied.

7. Apply E-Grip II evenly at a rate of 60 sq. ft. per gallon over smooth concrete. Various substrates may effect this coverage rate. Do not allow E-Grip II to cure on your hands or the flooring. Wipe off excess adhesive with a rag dampened with mineral spirits! Cured adhesive is very difficult to remove from hands. We strongly suggest wearing gloves when using the E-Grip II.

8. Place the molded pavers/tiles into the wet adhesive making sure that the edges are precisely placed along chalk lines where they intersect. Press firmly on the flooring to remove any curls or entrapped air.

D. LAYING TILES - OUTDOOR

1. Pavers: Interlock and shift whole pavers from left to right along chalk line #1 up to the perimeter border on the opposite side of chalk line #2. The last paver will likely have to be cut to fit against the perimeter border. See diagram 7 page 6.
2. Tiles & Paver tiles: Place the first tile into the wet adhesive making sure that the edges are precisely placed along the chalk lines and where they intersect. Press firmly on the tiles to remove any curls or entrapped air. See diagram 5a and 5b on page 5.

3. Continue this process with each row until you reach the perimeter border across from chalk line #1.

4. Go back and fill in gaps between the two original chalk lines and the wall on those two sides.

5. Roll a 150 lb roller over the floor within 30 minutes to ensure proper transfer of adhesive. Overlap each pass of the roller by 50% of the previous pass to ensure that the floor is properly rolled. Re-roll again after 30-45 minutes.

6. Keep foot traffic off the floor for a minimum of 24 hours. Foot traffic and rolling loads can cause permanent indentations in the uncured adhesive and cause tiles to shift.

E. LOOSE-LAIRED INSTALLATION: (FULL PAVERS ONLY)

1. BASE REQUIREMENTS
   a. Base must contain sand/crushed stone with perimeter border system.
   b. Pavers must be installed butting up against perimeter border system.

2. CRUSHED STONE SPECIFICATIONS
   a. 95% standard proctor compaction (as per ASTM D1557) is critical.
   b. Stone for the base must be crushed so it compacts to the above standard and should be a homogeneous mix of the following sizes:

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>% Passing by Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>1&quot;</td>
<td>90-100</td>

<td>3-5</td>
</tr>
<tr>
<td>#200</td>
<td>0-3</td>
</tr>
</tbody>
</table>

c. Minimum depth of crushed stone base should be 4".

d. Base can be flat or sloped 2%.

3. PROCEDURE
   a. Excavate soil approximately 12".
   b. Remove soil with approximately 9" of compacted crushed stone and approximately 1" of damp leveling sand.
   c. Install perimeter border system.
   d. Lay pavers in desired pattern.

VIII. ECOcomfort

A. INSTALLATION UNDER ECOsurfaces
   1. Install ECOcomfort on sub-base following sheet installation instructions.
   2. Adhere ECOsurfaces over ECOcomfort following recommended sheet or tile instructions.

B. INSTALLATION UNDER CARPET

1. COMPLETE GLUE-DOWN
   a. Install ECOcomfort on sub-base following sheet installation instructions.
   b. Adhere carpet to ECOcomfort using carpet manufacturer's recommended adhesive.

2. INSTALLATION WITH (WALL-TO-WALL) TACK STRIPS
   a. Install tack strips.
   b. Install ECOcomfort up to strips.
   c. Install carpeting over ECOcomfort following carpet manufacturer's recommended wall-to-wall installation instructions.
IMPORTANT INFORMATION FOR THE SPECIFIER

ECORE recommends JohnsonDiversey Maintenance Products and Procedures for ECOsurfaces.

Proper protection and maintenance of ECOsurfaces post-installation should be specified by the architect/designer. ECOsurfaces products are not pre-coated with a factory finish; therefore, they should not be subject to construction debris and potential damage caused from heavy duty construction activities.

FLOOR PROTECTION
The specifier should include specification details to protect the floor post-installation and until job construction is complete, such as covering the entire floor with paper or other floor covering device (plastic, plywood, etc.) until construction is completed and thorough cleaning and maintenance can be implemented.

ASSIGNMENT OF CLEANING AND MAINTENANCE
The specifier should determine and assign the responsibility for the initial cleaning and finishing. This responsibility should be specifically assigned to either the flooring contractor, general contractor, maintenance contractor or owner.

MAINTENANCE

TASKI CLEANING AND FINISHING PROGRAM
FOR ECOsurfaces (ECOnights, ECOsand,
ECOstone, ECOearth and ECOrocks only)

A. Initial Cleaning

1. Remove all surface soil, debris, sand and grit by sweeping, dust mopping or vacuuming.

2. Scrub floor with a neutral pH (7-8.5) detergent, such as TASKI profi cleaner (10 oz./gal. of water), using buffer or auto scrubber with TASKI purple pad or soft nylon brush.

3. Pick up solution with a wet vacuum, rinse with clean water and allow to dry thoroughly (6-8 hours).

B. Initial Floor Finish Application

1. Finish options:
   a. TASKI vision matte for a low satin finish. Apply 2-3 thin coats of finish. Work finish into flooring with a soft nylon brush and let it thoroughly dry between coats.

2. Provide sufficient cure time of final coat before allowing foot traffic (at least 2 hours).

C. Daily/Regular Cleaning

1. Sweep, dust mop or vacuum floor to remove surface soil, debris, sand and grit.

2. Damp mop with a microfiber mop or auto-scrub with a soft nylon brush or purple pad using TASKI profi (6-10 oz./gal. of water) or equivalent pH neutral cleaner.

   Note: FLOORS TREATED WITH TASKI VISION MATTE - When cleaning floors finished with vision matte use only a microfiber mop and nylon brush. Purple pads will remove finish on floors treated with vision matte.

E. Restorative Maintenance

Stripping the finish is not needed until there is noticeable accumulation of dirt and contaminants embedded in the finish. Normally this accumulation occurs in hard to reach and highest traffic areas. Following a good maintenance program, applying thin coats of finish when the look calls for it and only where it is needed will result in little finish build-up, increasing the time between stripping.

1. Sweep or vacuum to remove loose soil.

2. Heavy scrub using a rotary scrubber or automatic scrubber with a black or purple pad and stripper solution TASKI ice it.

3. Pick up solution with wet vac.

4. Rinse with clean water, allow floor to thoroughly dry.

5. Pick up solution with wet vacuum.

6. Allow floor to thoroughly dry.

7. Apply floor finish following initial finish application instructions.

F. Heavy Soil

1. Hard-to-clean and greasy areas may require a higher concentration of Taski profi (more than 10 oz./gal. of water).

IMPORTANT MAINTENANCE TIPS

- Use high CFM vacuum to pick up dust.

- Wait for floor to dry thoroughly before applying floor finishes, usually 24 hours.

- Apply only thin coats of floor finishes with finish mop. Buffing finish into the floor with a soft nylon brush is beneficial.

- For large areas, use auto scrubbers to clean floors (cont. on page 12).
**MAINTENANCE**

- For stripping floors, use TASKI ice-it and black or purple pad. Rinse thoroughly with clean water and wet vac up solution.

- For food areas, use TASKI profi (10 oz./gal. of water).

- For gum, use any generic gum remover, however, any solvent based product should be rinsed well with water to avoid damaging floor.

- For high traffic areas, top scrub and recoat floor as needed.

- Avoid flooding the floor.

For more information please contact JohnsonDiversey at 800-827-5427 or visit www.johnsondiversey.com

**TASKI CLEANING AND MAINTENANCE PROGRAM FOR ECOPAVE MOLDED PRODUCTS**
(Interlocking Pavers, Rectangular Tiles and Square Embossed Pavertiles)

**A. Outdoor Cleaning & Maintenance Procedures**

1. Daily cleaning: Sweep debris away or hose off dirt.

2. Periodic cleaning (as needed):
   Pressure wash with no more than 1200 psi maximum.

**B. Indoor Cleaning & Maintenance Procedures**

1. Daily cleaning: Vacuum floor or sweep floor to remove loose debris.

2. Periodic cleaning

   a. Vacuum floor or sweep floor to remove loose debris.

b. Wet scrub floor with TASKI profi cleaner (10 oz./gal. of water), using auto-scrubber with TASKI nylon brush.

c. Wet vacuum remaining soiled solution, rinse, and allow to dry thoroughly (6 - 8 hours).
WARRANTY

• ECORE is a corporation duly organized and validly existing under the laws of the Commonwealth of Pennsylvania. ECORE offers an express five (5) year warranty on the ECOsurfaces brand of recycled rubber flooring against defects in material and workmanship and that ECOsurfaces shall meet all published specifications and shall perform effectively.

• ECORE warranties that during the warranty period that ECOsurfaces shall not harden, become brittle, chip, crack, tear or exhibit any signs of excessive deterioration except for normal wear and tear.

• All other warranties including implied warranties for a particular purpose are expressly excluded. The sole remedy against the seller will be the replacement or repair of the defective goods, or at seller's option, credit may be issued not exceeding the selling price of the defective goods.
