

## SCUPPER DRAIN SYSTEM

[Scupper Drains](#) - for leakfree drainage at roof sidewalls. Scupper Drains are designed to provide efficient drainage with secure flashing termination at the difficult roofing/sidewall junction. Portals Plus Scupper Drains are all manufactured of heavy castings. An important feature is the removable bolted flashing clamp on the face. This flashing clamp allows the roofing membrane and flashing plies to be securely compressed and sealed at this low point of the roofing system. The outlet of the Scupper Drain can be positioned in any of three directions- horizontal, vertical, or 45 degrees. When used in conjunction with interior roof drains and a sloped deck or tapered insulation, Scupper Drains can be used as overflow drains. Portals Plus Scupper Drains are the solution to leaky fabricated sheet metal scuppers.
